

## The Origin Of Our Species

Right here, we have countless ebook the origin of our species and collections to check out. We additionally manage to pay for variant types and also type of the books to browse. The okay book, fiction, history, novel, scientific research, as skillfully as various additional sorts of books are readily user-friendly here.

As this the origin of our species, it ends occurring creature one of the favored books the origin of our species collections that we have. This is why you remain in the best website to see the unbelievable books to have.

Advances in genetic analysis have revealed the first glimmerings of an older origin for *H. sapiens*, with the discovery that we and our sister species, the Neanderthals, shared a last common ancestor about half a million years ago. Such developments have led some to question the classification of a diverse array of early fossils from across Africa.

The Origin of Our Species by Chris Stringer - review ...

On the Origin of Species (or, more completely, On the Origin of Species by Means of Natural Selection, or the Preservation of Favoured Races in the Struggle for Life), published on 24 November 1859, is a work of scientific literature by Charles Darwin which is considered to be the foundation of evolutionary biology. Darwin's book introduced the scientific theory that populations evolve over ...

As well as many scientific papers, He's also written a number of books, most recently The Origin of Our Species (2012, published in the USA as Lone Survivors: how we came to be the only humans on Earth), and Britain: one million years of the human story (2014, with Rob Dinnis). Series: Wolfson College Podcasts. People: Chris Stringer; Oxford Unit: Wolfson College; Keywords: human origins ...

The Origin of Our Species | University of Oxford Podcasts ...

The origin of our species is largely a description of what we know about human origins. It is not an autobiography, but Stringer's personal involvement in the saga comes through very well just the same. The debates are there too, and these days it is easy to forget that those areas where there is now consensus were once rather more fiercely fought over. In the 1970s and 1980s, there were far ...

Chris Stringer's bestselling *The Origin of our Species* tackles the big questions in the ongoing debate about the beginnings of human life on earth. Do all humans originate from Africa? How did we spread across the globe? Are we separate from Neanderthals, or do some of us actually have their genes? When did humans become 'modern' - are traits such as art, technology, language, ritual and belief unique to us? Has human evolution stopped, or are we still evolving? Chris Stringer has been involved in much of the crucial research into the origins of humanity, and here he draws on a wealth of evidence - from fossils and archaeology to Charles Darwin's theories and the mysteries of ancient DNA - to reveal the definitive story of where we came from, how we lived, how we got here and who we are. 'A new way of defining us and our place in history' *Sunday Times* 'When it comes to human evolution Chris Stringer is as close to the horse's mouth as it gets ... *The Origin of Our Species* should be the one-stop source on the subject. Read it now' *BBC Focus* 'Britain's foremost expert on human evolution ... you need a primer to make sense of the story so far. Here is that book' *Guardian* 'Combines anecdote and speculation with crisp explanation of the latest science in the study of the first humans ... an engaging read' *New Scientist* Chris Stringer is Britain's foremost expert on human origins and works in the Department of Palaeontology at the Natural History Museum. He also currently directs the Ancient Human Occupation of Britain project, aimed at reconstructing the first detailed history of how and when Britain was occupied by early humans. His previous books include *African Exodus- The Origins of Modern Humanity*, *The Complete World of Human Evolution* and most recently, *Homo Britannicus*, which was shortlisted for the Royal

Society Science Book of the Year in 2007.

This book evaluates the claims of scientific creationism versus materialistic evolution, while examining other scenarios. Consistently philosophical in methodology and perspective, the book is radically interdisciplinary in content, examining data and arguments drawn from natural science, philosophy, and theology. This work challenges the limits of human knowledge regarding every major question touching on human origins.

A leading researcher on human evolution proposes a new and controversial theory of how our species came to be. In this groundbreaking and engaging work of science, world-renowned paleoanthropologist Chris Stringer sets out a new theory of humanity's origin, challenging both the multiregionalists (who hold that modern humans developed from ancient ancestors in different parts of the world) and his own "out of Africa" theory, which maintains that humans emerged rapidly in one small part of Africa and then spread to replace all other humans within and outside the continent. Stringer's new theory, based on archeological and genetic evidence, holds that distinct humans coexisted and competed across the African continent—exchanging genes, tools, and behavioral strategies. Stringer draws on analyses of old and new fossils from around the world, DNA studies of Neanderthals (using the full genome map) and other species, and recent archeological digs to unveil his new theory. He shows how the most sensational recent fossil findings fit with his model, and he questions previous concepts (including his own) of modernity and how it evolved. *Lone Survivors* will be the definitive account of who and what we were, and will change perceptions about our origins and about what it means to be human.

This book describes a stunning new discovery in the evolution of our species-- the uncovering of a simple, natural equation that can

# Download Ebook The Origin Of Our Species

justifiably be called the  $E = mc^2$  of biology. This simple equation acts like a pair of magic spectacles, for the first time making visible what have previously been the invisible steps that led to the evolution of our species. It provides a prescription for how modern humans can increase lifespan still further, while at the same time "normalizing" lifetime risk of cancer from its current aberrant 40% to the 4% of other animals on this planet. And it shows why humans cannot colonize Mars, or engage in spaceflight far from Earth. This equation allows us to predict that the Milky Way will be luxuriant with life-- even intelligent life, of the sort exemplified by whales, and Orca, and elephants-- but devoid of our kind of life-- creatures who harnessed fire and used fire to leave their planet and travel into space. This simple equation shows why there are no other space-faring species in our galaxy, or in the local cluster of galaxies, or even to a distance of a million light years from Earth. If you are interested in the past and future evolution of our species-- who we are, where we came from, and who we can become-- then this is a book that you will enjoy.

Ancestral DNA, Human Origins, and Migrations describes the genesis of humans in Africa and the subsequent story of how our species migrated to every corner of the globe. Different phases of this journey are presented in an integrative format with information from a number of disciplines, including population genetics, evolution, anthropology, archaeology, climatology, linguistics, art, music, folklore and history. This unique approach weaves a story that has synergistic impact in the clarity and level of understanding that will appeal to those researching, studying, and interested in population genetics, evolutionary biology, human migrations, and the beginnings of our species. Integrates research and information from the fields of genetics, evolution, anthropology, archaeology, climatology, linguistics, art, music, folklore and history, among others Presents the content in an entertaining and synergistic style to facilitate a deep understanding of human population genetics

Informs on the origins and recent evolution of our species in an approachable manner

Modern Humans is a vivid account of the most recent—and perhaps the most important—phase of human evolution: the appearance of anatomically modern people (*Homo sapiens*) in Africa less than half a million years ago and their later spread throughout the world. Leaving no stone unturned, John F. Hoffecker demonstrates that *Homo sapiens* represents a “major transition” in the evolution of living systems in terms of fundamental changes in the role of non-genetic information. *Modern Humans* synthesizes recent findings from genetics (including the rapidly growing body of ancient DNA), the human fossil record, and archaeology relating to the African origin and global dispersal of anatomically modern people. Hoffecker places humans in the broad context of the evolution of life, emphasizing the critical role of genetic and non-genetic forms of information in living systems as well as how changes in the storage, transmission, and translation of information underlie major transitions in evolution. He also draws on information and complexity theory to explain the emergence of *Homo sapiens* in Africa several hundred thousand years ago and the rapid and unprecedented spread of our species into a variety of environments in Australia and Eurasia, including the Arctic and Beringia, beginning between 75,000 and 60,000 years ago. This magisterial work will appeal to all with an interest in the ever-fascinating field of human evolution.

Updates the author's classic work on the individuals, fossil discoveries, competing theories, and genetic research involved in the international quest for the human race's origins.

The hominin fossil record documents a history of critical evolutionary events that have ultimately shaped and defined what it means to be human, including the origins of bipedalism; the

# Download Ebook The Origin Of Our Species

emergence of our genus Homo; the first use of stone tools; increases in brain size; and the emergence of Homo sapiens, tools, and culture. The Earth's geological record suggests that some evolutionary events were coincident with substantial changes in African and Eurasian climate, raising the possibility that critical junctures in human evolution and behavioral development may have been affected by the environmental characteristics of the areas where hominins evolved. Understanding Climate's Change on Human Evolution explores the opportunities of using scientific research to improve our understanding of how climate may have helped shape our species. Improved climate records for specific regions will be required before it is possible to evaluate how critical resources for hominins, especially water and vegetation, would have been distributed on the landscape during key intervals of hominin history. Existing records contain substantial temporal gaps. The book's initiatives are presented in two major research themes: first, determining the impacts of climate change and climate variability on human evolution and dispersal; and second, integrating climate modeling, environmental records, and biotic responses.

Understanding Climate's Change on Human Evolution suggests a new scientific program for international climate and human evolution studies that involve an exploration initiative to locate new fossil sites and to broaden the geographic and temporal sampling of the fossil and archeological record; a comprehensive and integrative scientific drilling program in lakes, lake bed outcrops, and ocean basins surrounding the regions where hominins evolved and a major investment in climate modeling experiments for key time intervals and regions that are critical to understanding human evolution.

“The name Leakey is synonymous with the study of human origins,” wrote The New York Times. The renowned family of paleontologists—Louis Leakey, Mary Leakey, and their son Richard Leakey—has vastly expanded our understanding of human evolution. The Origin of Humankind is Richard Leakey’s personal view of the

# Download Ebook The Origin Of Our Species

development of Homo Sapiens. At the heart of his new picture of evolution is the introduction of a heretical notion: once the first apes walked upright, the evolution of modern humans became possible and perhaps inevitable. From this one evolutionary step comes all the other evolutionary refinements and distinctions that set the human race apart from the apes. In fascinating sections on how and why modern humans developed a social organization, culture, and personal behavior, Leakey has much of interest to say about the development of art, language, and human consciousness.
